

Collected Experiment Report: DecisionTree - RandomForest - GradientBoosting.

19/12/2024

Introduction

This is an automated report for the Experiment with tree models on traffic volume dataset; the following models have been analyzed:

- DecisionTree
- RandomForest
- GradientBoosting

Experiment description:

Experiment with tree models on traffic volume dataset

Model setup

The models have been used for the following forecast purposes:

- one_step
- multistep
- o recursive

The models have been optimized using the following hyperparameters:

- max_depth: [2, 4, 6, 8, 10, 15, 20]
- criterion: ['squared_error']
- random_state: [42]
- min_samples_split: [5, 10, 50, 150, 200, 250]
- min_samples_leaf: [5, 10, 25, 50, 100]
- scaler: [None, StandardScaler(), MinMaxScaler(), RobustScaler(), PowerTransformer()]

And with the following search algorithms:

grid

o random

The used performance measure is the r2 measure.

Dataset setup

The baseline dataset used for these forecasts is

the 'Metro Interstate Traffic Volume with hourly features and holiday markings.' dataset: 'Metro Interstate Traffic Volume with hourly features and holiday markings.'.

The test size used for the forecasts is 0.2.

ODataset 1

name: univariate_lagged

- dataset_type: univariate

prediction_type: one_step

- components: ['one_step_target', 'lagged_target']

ODataset 2

- name: univariate_temporal

- dataset_type: univariate

prediction_type: one_step

- components: ['one_step_target', 'temporal_features']

ODataset 3

- name: multivariate_lagged

dataset_type: multivariate

- prediction_type: one_step

- components: ['one_step_target', 'lagged_target', 'feature_columns']

ODataset 4

- name: multivariate_lagged_temporal

dataset_type: multivariate

- prediction_type: one_step

- components: ['one_step_target', 'temporal_features', 'feature_columns', 'lagged_target']

ODataset 5

- name: univariate_lagged_multistep

- dataset_type: univariate

- prediction_type: multistep

- components: ['multistep_target', 'lagged_target']

ODataset 6

- name: multivariate_lagged_temporal_multistep

- dataset_type: multivariate

- prediction_type: multistep

- components: ['multistep_target', 'temporal_features', 'feature_columns', 'lagged_target']

Results

For the models; DecisionTree, RandomForest, GradientBoosting, the following models and datasets yielded the best results.

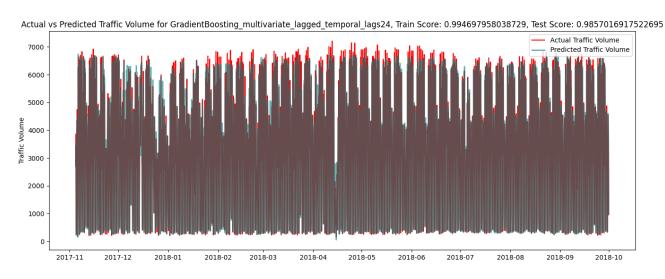

The best model for one_step forecasting.

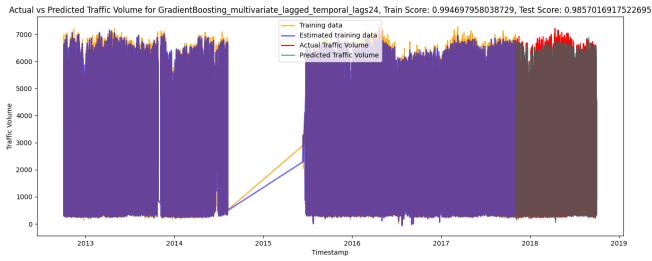

The best model for one_step forecasting is the GradientBoosting model.

The model has been trained on the multivariate_lagged_temporal_lags24 dataset.

The best score for the one_step forecasting is 0.9857016917522695.

Best GradientBoosting forecast over time

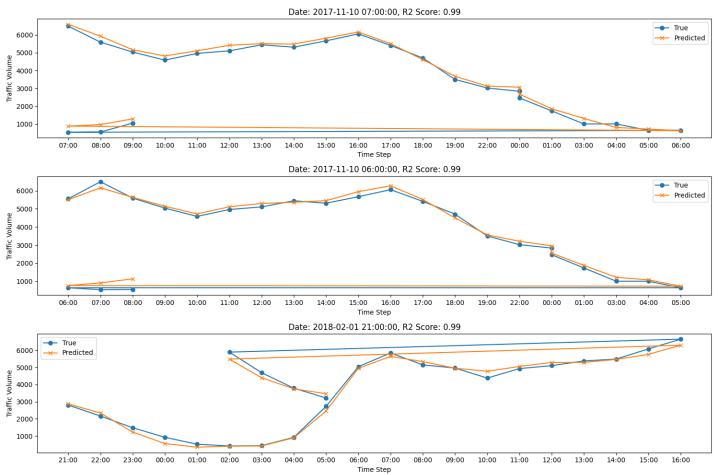

The best model for multistep forecasting.

The best model for multistep forecasting is the GradientBoosting model.

The model has been trained on the multivariate_lagged_temporal_multistep_lags24_steps24 dataset.

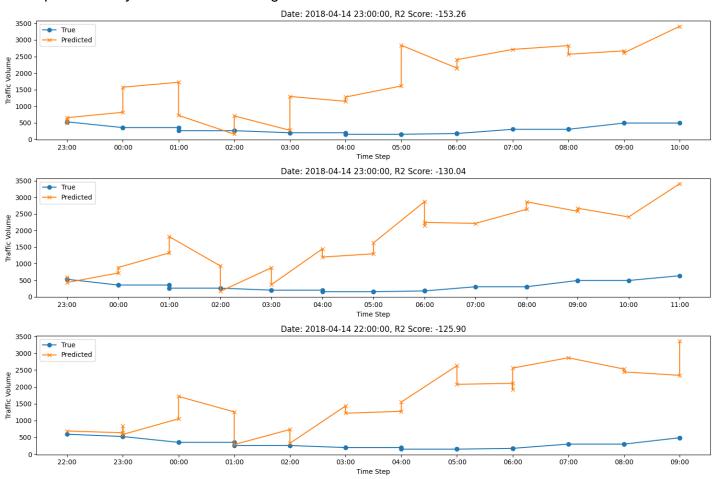

The best score for the multistep forecasting is 0.7157022388304296.

Best predicted days for GradientBoosting.

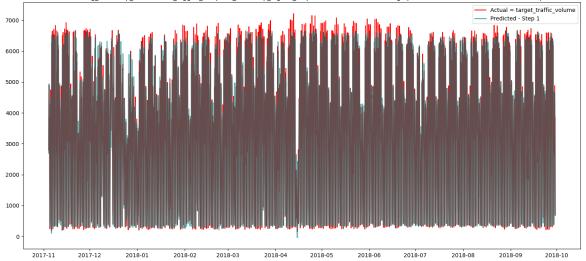

Worst predicted days for GradientBoosting.

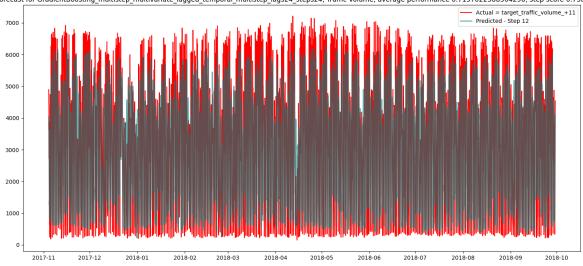

Steps plots for GradientBoosting forecasts over time

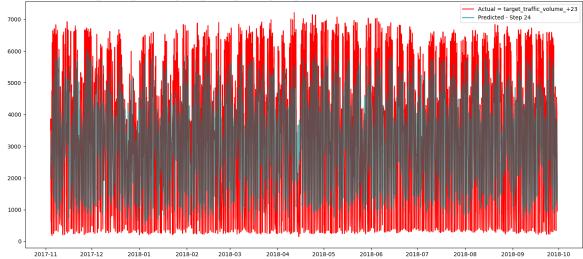

Multistep forecast for GradientBoosting_multistep_multivariate_lagged_temporal_multistep_lags24_steps24, Traffic Volume, average performance 0.7157022388304296, step score 0.7388205137663082

Multistep forecast for GradientBoosting_multistep_multivariate_lagged_temporal_multistep_lags24_steps24, Traffic Volume, average performance 0.7157022388304296, step score 0.4215456325235043

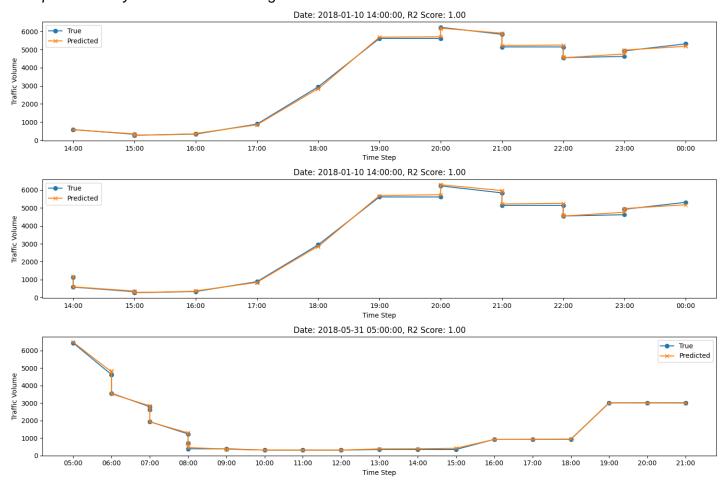

The best model for recursive forecasting.

The best model for recursive forecasting is the GradientBoosting model.

The model has been trained on the multivariate_lagged_temporal_lags24 dataset.

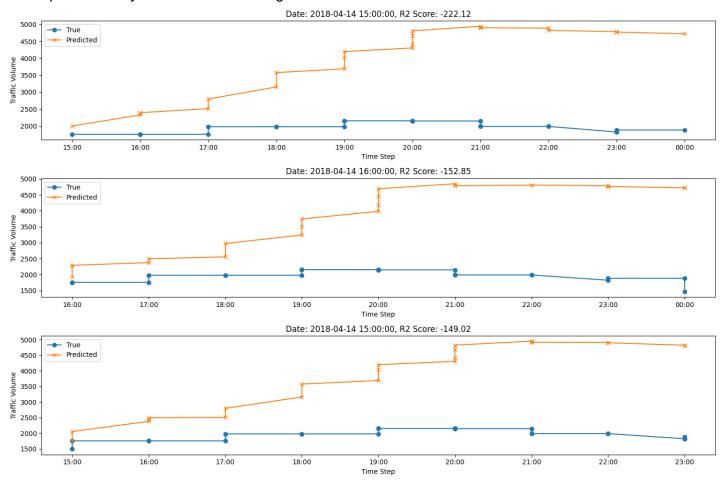

The best score for the recursive forecasting is 0.9390235735844598.

Best predicted days for GradientBoosting.

Worst predicted days for GradientBoosting.

Steps plots for GradientBoosting forecasts over time
